## iCame

## iSaw

(A MOUNTAIN LION)...  
and

## iPartied!

by Sue Beal

Jack Buccellato, our speaker.

Jack Buccellato and Chris Muller of All Keys Computer-Guy were our July speakers. (Well, Jack did all the speaking and Chris had his back!) We had a 2-part presentation. Part one was on Mountain Lion, the new OS X, and part two was the iParty, about integrating and getting the most from your digital devices. The room was very festive, with balloon figures (see page two), the big iParty banner, and special decorations and refreshments! We were prepared for a larger turnout than we got, but the 33 who came went home well fed on information *and* pizza!

### Mountain Lion

Jack started with telling us who *can't* run Mountain Lion - if you have an Intel chip set for video, it won't run for you. (See page two for more info on this.) Jack also says, as he always says, "if you're happy you don't need to upgrade!" If you really must have the new features, then go for it.

IOS 6 (for handheld devices) is coming in the fall. Mountain Lion sets the stage for what's coming.

Jack's favorite concept is "convergence" - all of our digital devices coming together, moving closer, being connected through the internet. This is congruent with Steve Jobs' vision of our journey - it's a little like Star Trek, but it's where we're headed!

So what does this mean, really? Sharing through social media, creating documents on one device and having them available on others, connecting your mobile devices to your TV in your living room, connecting with your friends and family with Face Time, integrating Notifications and geo-info (Location Services) into your lifestyle.

Yikes!! That's a lot of technology! What does it mean to you? Here are a couple of examples Jack used:

You go to a nephew's piano concert and use the iPhone and Face Time to share it with family members that couldn't make it.

You set up a reminder on your iPhone so that when you get near Winn Dixie, it reminds you to buy dog food.

See? Not scary at all!

### iCloud

People struggle with where/what iCloud is. iCloud is a bunch of computers (servers) at a data center in NC that Apple built. Your data isn't on your handheld device; it's in those computers and accessed via the

internet. If you've ever used gmail for email, you're familiar with the concept; they have the files but you can go access them any time from a computer or handheld device.

Documents created on your iPad don't stay there. They go into iCloud so you can access them from other devices.

### Share Button

Sharing is built in to Mountain Lion. Share good times, memories, talk with friends. All the tools are built into the OS's Share button. Surfing the internet and see something cool? Hit the Share button and off it goes. Apple is moving away from having to mechanically copy and paste links, it's going to be more seamless; easier.

### iMessage

Instant messaging is coming to the desktop. This messaging goes through Apple servers, not through AT&T. If you send to another Apple person, it goes completely through Apple's delivery system. If the recipient is outside Apple's reach, then it

 Apple User Group Upper Keys Mac User Group Meeting

## Online Genealogy

LECTURE/DEMONSTRATION

### Where The Past and Today's Technology Meet

Interested in digging up your family roots?

With the popularity of TV shows like NBC's "Who Do You Think You Are?" and the PBS series "Finding Your Roots," many people are discovering an interest in genealogy.

The internet and your computer are perfect for organizing and researching. Both Mac and Windows users will learn about software, search engines, genealogy sites and other tools to create your family tree and document your family history.

**Beginner's Circle**

Come at 6:30 for Help for Mac Beginners: Bring your laptop and your questions; for a half-hour prior to the main meeting we'll have experienced folks available to help!

**Free and open to the public!**

Key Largo Library Community Room,  
MM 101.4 Oceanside Tradewinds Plaza

gets routed through an external method.

Sending data through texting is now faster and the limit is up to 100MB(!). You can send video via text messages, eliminating the need to email.

There's a Typing Indicator to let you know the other person is there, working on an answer to your text.

And Message Groups make it easy to organize who you're communicating with. (Uses the same addresses as your iPad, iPhone and desktop.)

### **Notification Center**

Your appointments and calendars under Mountain Lion will be integrated on all your devices. The interface is a banner that pops down from the top of the screen, to show you your alerts. Twitter and Facebook alerts are built into this, so there's no special app needed for those in Mountain Lion.

### **Dictation "Siri on Steroids"**

This is a much-coveted new feature. Much like Dragon Dictation, but it's built in at no extra cost. You talk; it types. It even understands foreign languages!

### **Video**

Jack and Chris showed a really cool video about what these advances in technology can do for people. A blind man can take a contemplative walk in the woods alone... Students in India are learning anatomy with a 3D app... a B&B renting treehouse

We had our own Mountain Lion balloon mascots, courtesy of the talented Kathy Miller, AKA Cupcake the Clown. She is available to make and deliver custom balloon bouquets for special occasions and can spice up an event in full costume, complete with schtick! Contact her at 304-8861.

SPECIAL THANKS to Karen for pizza and cupcakes for the party - *SHE BAKED*, who knew!! And THANKS also to Karen & Kathy for the great decorations! (More info below.)

### **See all the new features:**

<http://www.apple.com/osx/whats-new/>

units in Vermont runs the entire business with an iPhone... the iPad is used as speech therapy tool for kids.

We are seeing these devices change our world... and no one does it like Apple!

*continued on page three*

## **Can you upgrade to Mountain Lion?**

*by David Gitin / George Mattingly*

Not all Macs will work with OS X 10.8. To find out if your Mac will run Mountain Lion, open the Terminal app and run this command: `ioreg -l -p IODeviceTree | grep firmware-abi`

If it returns "EFI32" then no Mountain Lion for your Mac. If it returns "EFI64" it should be fine.

<http://arstechnica.com/apple/2012/07/confirmed-mountain-lion-sends-some-64-bit-macs-gently-into-that-good-night/>

## **Mountain Lion Facts**

*from MacWorld*

You'll be able to pick up a copy of Mountain Lion for just \$20. (By way of comparison, Lion cost \$30)

### **How will I get my hands on Mountain Lion?**

The same way you got a hold of Lion—via the Mac App Store. Apple seems pretty happy with its online distribution method, with more than 26 million copies of Lion sold in the last year. When it's time to pick up Mountain Lion, you'll queue up in front of your computer rather than a physical store. Like Lion, Apple will let you pay for and download one copy of Mountain Lion that you can install on multiple Macs—a welcome feature for multi-Mac households.

### **Will I need to be running Lion to upgrade to Mountain Lion, or can I upgrade straight from Snow Leopard?**

You need to be running at least the latest version of Snow Leopard (OS X 10.6.8) to install Mountain Lion.

**Which Macs will be able to run Mountain Lion?** Your Mac must be one of the following models:

- iMac (Mid 2007 or newer)
- MacBook (Late 2008 Aluminum)
- MacBook (Early 2009 or newer)
- MacBook Pro (Mid/Late 2007 or newer)
- MacBook Air (Late 2008 or newer)
- Mac mini (Early 2009 or newer)
- Mac Pro (Early 2008 or newer)
- Xserve (Early 2009)

If you are running Lion, you can find out if your current Mac qualifies by clicking the Apple icon at the top left of your screen, choosing About This Mac, then clicking More Info.

**iParty**

The iParty idea is that it's a non-rigid learning experience in an atmosphere of fun. "What can I do with this thing?" The iParty is about the fun stuff you can do.

Here's where I have to come clean and admit that we hamstrung Jack and Chris with a technology glitch at the meeting. Think about the dynamics of all this handheld device stuff; it's hard to share what's in your hand with a group of over 30 people...unless you have Apple TV and an HDMI hookup to a big screen.

We have AirPlay and mirroring built into IOS 5, and these are easily used to "push" the image on the tiny screen of a handheld device to the big screen. (I can do it in my living room!) Unfortunately we didn't get that set up properly for the meeting, so the people there didn't get to see it in action.

Pro that he is, Jack adapted his presentation on the fly and we still got a tremendous amount of great information about what our handheld devices can do.

**Gestures**

Gestures are how you use your fingers on a touch screen or touch pad to accomplish things.

Use 2 fingers in a pinching motion or the reverse to zoom in and out.

Use 5 fingers in the pinching motion to get back to your desktop. Yeah, you can just push the button and accomplish the same thing but Steve hated buttons. Do it for Steve. You can even slow it down and get a cool special effect!

Use 4 fingers to... swipe up to reveal the multitasking bar; swipe down to hide it; and swipe left or right to switch between active applications.

The Magic Mouse also utilizes Gestures. You either love it or hate it, I know! Jack predicts the mouse button will go away.

**Settings**

This little icon is the true power behind your handheld device. Jack was talking using an iPad, but many of the same settings are found on the iPhone and iPod Touch.

Jack encourages you to look around in there. You can't hurt it. Pay attention to what you are doing, take a breath, undo it if you don't like it. (And if you really get stuck, call Jack for free support!!) No fear!

On the iPad in Settings you see 2 columns of information. Select the category on the left and the stuff on the right side changes accordingly.

**Convergence Settings** - at the top you see convergence settings: WiFi (on/off/access), Notifications, Location Services.

**Notifications** - set which apps are Notifications-aware. Set how you get alerted: Sounds: plays an audible alert; Alerts/Banners: displays an alert or banner on the screen; and Badges: Displays an image or number on the application icon.

**Location Services** - activates the GPS in your device so it knows where it is. On a Google map you can see where you are, down to the building you're in! Then you can route a path to find where you want to go, or create location-dependent reminders (use the Reminders app). Urban Spoon and Yelp are other examples of location-dependent apps. There's even an app for augmented reality. Hold up your device as a camera, and the app displays information about what you're looking at!

**Cellular Data Settings** - (only for 3G capable devices). If you have a 4S iPhone you can hook up your iPad to the internet via WiFi from your iPhone!

**Other settings** - Brightness, Wallpaper, Picture Frame. Choose between two transitions—Dissolve and Origami—set the time that each photo is on the screen, choose whether to zoom in on faces, and more.

**General Settings** - OK, this is the "meat and potatoes" of the settings. Set how many songs and pictures you can store; how your battery life is managed, your networking information. You can even get your system updates by setting it up here (no need to plug into a computer). Lock rotation of your screen if you prefer; mute; Bluetooth settings; and check your free space. All under General Settings.

**iCloud Settings** - What to sync on this device. Nothing stores on an iPad unless you explicitly put it there - it goes into iCloud. Take charge of what's syncing, don't let it default!

**Mail/Contacts/Calendars Settings** - you can set text size, number of lines of preview, "ask before delete," sort order and more.

**More to come**

We ran out of time before Jack ran out of good stuff to share with us. Look forward to a continuation of this topic in the coming months. Thank you, Jack and Chris!! 

## Older generation meets younger technology!

A daughter is visiting her father and is helping in the kitchen. She asks... "Tell me dad, how are you managing with the new iPad we gave you for your birthday."

The conversation is in German but you will have no problem understanding. Thank you, Susie Ley, for sending this one.

## It Happened Here,

*A Location-based App*

*from Karen Beal*

History buffs and travelers will love It Happened Here, which links your location to historical events, movie scenes, famous crimes and political scandals that occurred nearby.

It Happened Here app shows users interesting factoids about locations close to them. Kicking it in Georgetown in D.C. and want to see the infamous stairs that Father Karras threw himself down at the end of The Exorcist? The app uses Google Maps and will show a pin with your location and a pin for the nearest events around you. Just follow the map on your phone and you will soon find yourself standing at the bottom of the steps of cinematic lore. **MU**

## Strong Passwords

*by Jack Buccellato*

You can have strong passwords and still be able to remember them. You need three passwords...

### Generic Password

Pick something easy to remember for when you have to log in to a site where the consequences of anyone guessing this password would be negligible.

### Strong Password

Take a word or phrase - maybe your favorite catch phrase or the first few words of a quote. Spell it uniquely, in your own way. Transpose some numbers for letters - i=1; B=8; E=3... like that.

This mid-level security is good for iTunes, email and other account-driven sites, where it would be inconvenient if someone guessed your password.

### Ultra-Super-Secret Password

Start like the strong password above but use special characters as well. Stay away from exclamation points, parentheses or periods, as these have special meanings in computer code and can mess you up. Use underscore, hyphen, asterisk, etc. Use upper and lower case letters too.

Use this one for your bank account and other high-security needs.

Write the 3 passwords down a few times. Really get them drilled into your brain. Then eat the paper. You can also store them as secure notes in Keychain. **MU**

## Retailers Have Ways to Keep Tabs on Customers as They Shop

*by ANTON TROIANOVSKI, WSJ  
submitted by Lindi Mallison*

Companies that develop WiFi networks have a new pitch for retailers and marketers: Use the technology to keep tabs on customers, just as Amazon.com tracks online shoppers.

WiFi giant Boingo Wireless Inc. is getting ready to test a system that tracks traffic patterns in malls and stores by using the signals emitted by shoppers' smartphones as they hunt for WiFi networks.

Meanwhile, start-up Nearbuy Systems is trying to sell retailers on technology that cross-references the websites shoppers visit on their phones with their physical location in the store. **MU**

## Unexpected uses for the Arrow Keys

*submitted by Karen Beal*

### Select Finder items in icon view

When you're in a Finder window looking at files using the icon view (View -> As Icons), pressing Tab selects the next alphabetic item no matter where its icon may be. But what if you want the item next to the currently selected one (or above or below it)? You don't need your mouse or trackpad for this basic task. Use an arrow key to move to the item—even if it's in a different row because the window's sorted into groups with the Arrange By command.

### Scroll windows in Preview or Safari

In Apple's Preview or Safari, you can use the scrollbar to move up and down through the window. Or keep your hands on the keyboard and press the Up or Down arrow key to scroll a little bit at a time. Usually you'll move the equivalent of one or two lines of text, although your mileage will vary based on the zoom level you're using.

**Bonus Tip** To scroll down in bigger chunks, press the spacebar; press Shift-spacebar to scroll up.

### Play a different tune in iTunes

When you're listening to your music in iTunes, the Up and Down arrows select the previous or next item in your playlist, but don't affect what's playing. Use the Left or Right arrow to play the previous or next track—relative to what's currently playing, not to what's selected. (There's no need to press Command along with the arrow keys, despite what's noted in the Controls menu.)

### Control Safari's autofill

When you start to fill out a website form—a single letter in one field is often enough—Safari will show a pop-up with one or more suggestions as to where it might grab the information for the form. Save yourself the effort of a click or tap: Press the Down arrow when you see the pop-up to select what information you want used, and then press Return. **MU**

## Idiot Tips

*from Karen & Sue*

We all have moments when the dumbest thing brings us to a halt. Here are a couple of things we just ran into... just so you know you aren't the only one making dumb mistakes! We made *all* of these!

**Mouse not working?** Check where the USB cord is plugged in!

**Mouse/Keyboard failure?** Check to make sure your F6 lock isn't on!

**Internet not there?** Same thing - check the DSL line or however you connect. (Is it my cats who unplug these things at night?)

**Screen looks dead on laptop?** Check the brightness button before you call for support!

**DVD stuck in the drive?** Restart the computer while holding the mouse button down to get it to pop!

**Email with photo taking forever to send?** Stop and check the size of that attachment!! **MU**

# Who knew what the Space Bar could do!

submitted by Karen Beal

Found these tips for the space bar Quick Look function. Some I knew, some I did not!

## View multiple files with Quick Look

If you've selected a file in the Finder and viewed it with Quick Look, it's easy to check out other files in the same folder too. Just press the arrow keys. If you're in List View or Column view, press the up- or down-arrow keys to view other files. If you're in Icon View, you can move up and down, but you may need to use the right- and left-arrow keys to see items in other columns. Using this technique, you can leaf through a whole folder of files by selecting the first one, pressing the spacebar, and then using the arrow keys to see the others.

## See more than just the first page

When you open a multiple page file with Quick Look, you can scroll through it to see the entire document. For example, if you select a PDF file and press the spacebar, the first page will appear along with thumbnails of the other pages in a sidebar to the right. To read these pages, click on them, or press the Page Up or Page Down buttons to move through them. (If you're on a laptop, you'll use Fn-Up Arrow and Fn-Down Arrow.) This works with documents created with Pages, Numbers, and Keynote, as well as with Word, Excel, and PowerPoint, among others.

## Preview attachments in Mail

If you receive an attachment with an email message in Mail (and OS X can read that attachment), you can click on the Quick Look button near the top-right of the message to see it.

If there's more than one attachment, arrows will appear at the top-left of the Quick Look window; click on one of these to see the next or previous attachment.

When you've finished viewing your attachment, press the spacebar, or click on the close button (labeled with an x) to dismiss the Quick Look window.

## Look more closely at Spotlight results

If you use Spotlight to search for files on your Mac, you can access a kind of Quick

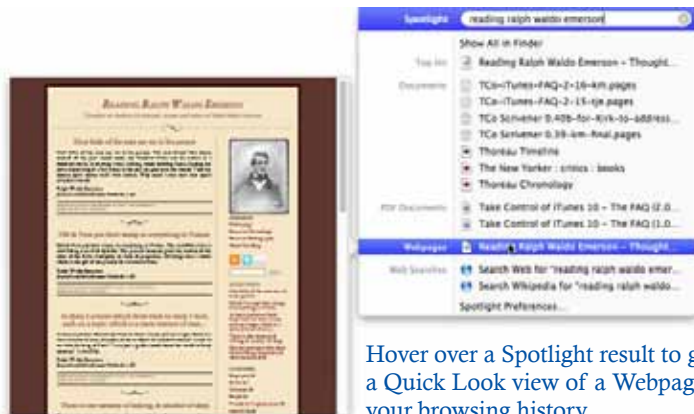

When you view a multiple page document with Quick Look, click on the thumbnails to the right to see different pages.

Look option when you're looking at your results. Hover your cursor over a search result to see the contents of the file. For example, hover over a Webpage to see what it looks like; hover over a video or music file, then move your cursor over the display and click the arrow button to play it; hover over a Word document to see its content.

## See what's in the Trash

You put some files in the Trash, but now you're starting to wonder if you mistakenly tossed out something important. OS X won't let you open files in the Trash, so you might think you have to copy everything to another folder in order to check. No need. Select the files and press the spacebar to see them with Quick Look. **MU**

Hover over a Spotlight result to get a Quick Look view of a Webpage in your browsing history.

## The Wayback Machine

by Gary Kampel

Besides being an interesting techno-archeological tool, if you've ever 'lost' your website, the Internet Archive Wayback Machine might save your brass.

The Wayback Machine is a digital time capsule created by the Internet Archive non-profit organization, based in San Francisco, California. It is maintained with content from Alexa Internet. The service enables users to see archived versions of web pages across time, which the Archive calls a "three dimensional index". Internet Archive bought the domain waybackmachine.org for their own site. It is currently in its beta test.

The name Wayback Machine is a reference to a segment from The Rocky and Bullwinkle Show in which Mr. Peabody and Sherman use a time machine called the "WABAC machine" to witness, participate in, and, more often than not, alter famous events in history.

Browse through over 150 billion web pages archived from 1996 to a few months ago. To start surfing the Wayback, type in the web address of a site or page where you would like to start, and press enter. Then select from the archived dates available. The resulting pages point to other archived pages at as close a date as possible.

It can help you "recover" a website after a hard drive crash, or other disaster.

Take a look.

<http://archive.org/web/web.php> **MU**

## Free Images

by Karen Beal

Have you checked out MS clip art lately? Some nice royalty free stuff, there for the taking. [www.office.microsoft.com/en-us/images/](http://www.office.microsoft.com/en-us/images/) **MU**

# Yes, Virginia, you can download all of your iTunes purchases again

from the Internet Patrol

What's a person to do when their hard drive crashes, and they lose all of the songs that they purchased from iTunes? There is no option to re-download all of your iTunes purchases offered through either iTunes or the Apple website. However, while you may get chastised for not backing up your iTunes library (which you will do from now on, right?), it is possible to re-download all of your iTunes songs purchased through iTunes again, and restore your iTunes purchases.

First, it's important to understand that Apple has always had a policy of not letting people download iTunes music purchases more than once per purchase, and that undoubtedly has to do with royalties that they have to pay on each download. So you get to download the song that you purchase through iTunes exactly once.

And Apple strongly urges you (and rightly so) to backup your iTunes library (and of course you should always make a regular backup of all of your data).

But, shift happens, and what can you do if, somehow, you lose your only copies of the songs that you have downloaded through iTunes?

Well, as it happens, Apple isn't heartless, and they do have a way for you to recover those songs that you purchased and downloaded through iTunes.

In fact, with iTunes 10.3, it's very easy. In fact, the hardest part is upgrading to 10.3 if you haven't already (and let's face it, generally speaking that's not very hard).

## TopXNotes is on Wikipedia!

by Jim Lee

Some years back I attempted to get TopXNotes into Wikipedia. I spend a lot of time organizing the materials and editing it. I was inspired by what I wrote about Will Shipley and Delicious. I think Delicious and BBEdit were a few of the early ones to get in. Back then they apparently did not approve of anything that might be considered self-promotion, so it all was removed. I got flustered and gave up. But recently I asked a few friends if anyone would consider writing an article and friend and super-tester Robert responded. He has a lot of work into the article and it is finally live.

I am proud to announce that we just got TopXNotes into Wikipedia, a huge step in helping our natural Google ranking. Please feel free to rate it, and make edits, or to make suggestions on how it can be improved.

Here is the article link:

<http://en.wikipedia.org/wiki/TopXNotes>

If you decide to make a few edits, please set up a Wikipedia account and log in first. That apparently works better with the Wikipedia system. **MU**

But first, make absolutely sure that you don't have any copies, anywhere. It's only prudent.

Once you are really sure that those iTunes songs are gone, here's what to do:

1. Open the iTunes Store on your device.
  2. Make sure you are signed in with the same account used for the original purchase.
  3. Tap Purchased from the bottom navigation bar.
  4. From the Purchased tab, tap the artist name for the content you intend to download again.
  5. Once you've located the music you are looking for, tap the download button.
- (If you want to download all songs from an album that you've purchased, click on the button to switch to the "Album" view.)

## MobileMe customers last chance to rescue data

by Lex Friedman, Macworld.com  
via Gary Kampel, SEMUG

You were warned. Back in June 2011, Apple announced that MobileMe would close its virtual doors come June 30, 2012. And indeed, MobileMe followed eWorld, Pippin, and the Newton into that great Infinite Loop in the sky.

But what about those MobileMe customers who hadn't yet made the switch to iCloud? If, despite Apple's warnings, you still didn't migrate over your MobileMe accounts, Gallery photos, and iDisk files, you're in luck: "For a limited time," Apple says, you can still rescue your old data.

How much time is a limited time? Apple's not saying, and the company didn't immediately respond to Macworld's request for comment. If you're the kind of person who likes to wait until the last moment, it would appear that moment is now. Log in at me.com, and Apple will guide you through the process of embracing iCloud and backing up any data you have stored in the shuttered service.

We've already opined on why Apple ditched MobileMe in favor of iCloud, but even if you will miss the old service, remember that iCloud offers at least one major advantage: Unlike MobileMe, it's free, at least for your first 5GB of cloud-based storage. And don't forget that you can continue to access your old MobileMe email even after the MobileMe reprieve draws to a close. **MU**
